

The MiniJava Type System

CS3300 course revision — 7 September 2026

Based on Jens Palsberg's *The MiniJava Type System*, October 2011

This course revision incorporates the Assignment 2 clarifications into the rules themselves. Rule (16) permits covariant return types in overriding; rule (21) permits a return expression to have a subtype of the declared return type. Section 4 explicitly includes reflexivity for all MiniJava types. Rule (15) remains unchanged. Original section and rule numbers are retained; rule (16) is split into (16a) and (16b). Method types consistently omit parameter names.

1 What is MiniJava?

MiniJava is a small Java-like language with classes, single inheritance, methods, integer arrays, and basic statements and expressions. Method overloading is not allowed.

The statement `System.out.println(...);` prints integers, and `e.length` applies to an expression of type `int[]`.

2 Syntax

The core syntax below follows the original reference. The [course MiniJava grammar](#) specifies the complete syntax accepted in Assignment 2, including its additional operators and statement forms. Nonterminals are italic, keywords are in typewriter font, and lists written with dots may be empty. Superscripts and subscripts distinguish metavariables.

$$\begin{aligned}
 \textit{Goal} \quad g &::= mc \, d_1 \dots d_n \\
 \textit{MainClass} \quad mc &::= \texttt{class } id \{ \texttt{public static void main (String[] } id^S \{ \\
 &\quad t_1 \, id_1; \dots; t_r \, id_r; \, s_1 \dots s_q \} \} \\
 \textit{TypeDeclaration} \quad d &::= \texttt{class } id \{ t_1 \, id_1; \dots; t_f \, id_f; \, m_1 \dots m_k \} \\
 &\quad | \texttt{class } id \texttt{ extends } id^P \{ t_1 \, id_1; \dots; t_f \, id_f; \, m_1 \dots m_k \} \\
 \textit{MethodDeclaration} \quad m &::= \texttt{public } t \, id^M (t_1^F \, id_1^F, \dots, t_n^F \, id_n^F) \{ \\
 &\quad t_1 \, id_1; \dots; t_r \, id_r; \, s_1 \dots s_q \texttt{return } e; \} \\
 \textit{Type} \quad t &::= \texttt{int}[] \mid \texttt{boolean} \mid \texttt{int} \mid id \\
 \textit{Statement} \quad s &::= \{ s_1 \dots s_q \} \mid id = e; \mid id[e_1] = e_2; \\
 &\quad | \texttt{if } (e) \, s_1 \texttt{ else } s_2 \mid \texttt{while } (e) \, s \\
 &\quad | \texttt{System.out.println}(e); \\
 \textit{Expression} \quad e &::= p_1 \texttt{\&\&} p_2 \mid p_1 < p_2 \mid p_1 \texttt{!=} p_2 \mid p_1 + p_2 \mid p_1 - p_2 \mid p_1 * p_2 \\
 &\quad | p_1[p_2] \mid p.\texttt{length} \mid p.id(e_1, \dots, e_n) \mid p \\
 \textit{PrimaryExpression} \quad p &::= c \mid \texttt{true} \mid \texttt{false} \mid id \mid \texttt{this} \\
 &\quad | \texttt{new int}[e] \mid \texttt{new } id() \mid !e \mid (e) \\
 \textit{IntegerLiteral} \quad c &::= \langle \texttt{INTEGER LITERAL} \rangle \\
 \textit{Identifier} \quad id &::= \langle \texttt{IDENTIFIER} \rangle
 \end{aligned}$$

In a type position, *id* must name a declared class: for example, `Animal` in `Animal pet;` is a class type.

3 Notation for Rules

An inference rule has the form

$$\frac{\textit{hypothesis}_1 \quad \textit{hypothesis}_2 \quad \cdots \quad \textit{hypothesis}_n}{\textit{conclusion}}.$$

It states that the conclusion follows whenever every hypothesis holds. A rule with no hypotheses is an axiom; its horizontal bar may be omitted. A derivation is a tree whose leaves are axioms and whose internal nodes apply inference rules. The root is the judgment established by the derivation.

4 Subtyping

We write $t_1 \leq t_2$ when t_1 is a subtype of t_2 . The relation is reflexive on *all* MiniJava types. On class names, it is the reflexive, transitive closure of the declared **extends** relation.

$$t \leq t \tag{1}$$

$$\frac{t_1 \leq t_2 \quad t_2 \leq t_3}{t_1 \leq t_3} \tag{2}$$

$$\frac{\text{class } C \text{ extends } D \dots \text{ is in the program}}{C \leq D} \tag{3}$$

In particular, rule (1) includes

$$\text{int} \leq \text{int}, \quad \text{boolean} \leq \text{boolean}, \quad \text{int}[] \leq \text{int}[].$$

There are no subtype relationships between these three types, or between any of these types and a class type. Thus the only subtype of each of **int**, **boolean**, and **int[]** is itself.

5 Type Environments

A type environment A is a finite mapping from identifiers to types; its domain is written $\text{dom}(A)$. For pairwise distinct identifiers, $[id_1 : t_1, \dots, id_r : t_r]$ maps id_i to t_i for $i \in 1..r$. Environment composition gives the right-hand environment precedence:

$$(A_1 \cdot A_2)(id) = \begin{cases} A_2(id) & \text{if } id \in \text{dom}(A_2), \\ A_1(id) & \text{otherwise.} \end{cases} \tag{4}$$

6 Helper Functions

6.1 The *classname* Helper Function

The function `classname` returns the name of a class declaration.

$$\text{classname}(\text{class } id \{ \text{public static void main}(\text{String}[] \ id^S) \{ \dots \} \}) = id \quad (5)$$

$$\text{classname}(\text{class } id \{ t_1 \ id_1; \dots; t_f \ id_f; m_1 \dots m_k \}) = id \quad (6)$$

$$\text{classname}(\text{class } id \text{ extends } id^P \{ t_1 \ id_1; \dots; t_f \ id_f; m_1 \dots m_k \}) = id \quad (7)$$

6.2 The *methodname* Helper Function

The function `methodname` returns the name of a method declaration.

$$\text{methodname}(\text{public } t \ id^M(\dots) \ \dots) = id^M \quad (8)$$

6.3 The *distinct* Helper Function

The predicate `distinct` checks that identifiers in a list are pairwise distinct.

$$\frac{\forall i \in 1..n : \forall j \in 1..n : id_i = id_j \Rightarrow i = j}{\text{distinct}(id_1, \dots, id_n)} \quad (9)$$

6.4 The *fields* Helper Function

The environment `fields(C)` contains the fields of *C* and its superclasses. Fields declared in *C* take precedence over inherited fields of the same name.

$$\frac{\text{class } id \{ t_1 \ id_1; \dots; t_f \ id_f; m_1 \dots m_k \} \text{ is in the program}}{\text{fields}(id) = [id_1 : t_1, \dots, id_f : t_f]} \quad (10)$$

$$\frac{\text{class } id \text{ extends } id^P \{ t_1 \ id_1; \dots; t_f \ id_f; m_1 \dots m_k \} \text{ is in the program}}{\text{fields}(id) = \text{fields}(id^P) \cdot [id_1 : t_1, \dots, id_f : t_f]} \quad (11)$$

6.5 The *methodtype* Helper Function

The value $\text{methodtype}(id, id^M)$ is the ordered list of parameter types and return type of method id^M in class id , including inherited methods. It is $\perp$ if no such method exists. A method type has the form $(t_1, \dots, t_n) \rightarrow t$. Parameter names are not part of the method type.

$$\frac{\begin{array}{l} \text{class } id \{ \dots m_1 \dots m_k \} \text{ is in the program} \\ \text{for some } j \in 1..k : \text{methodname}(m_j) = id^M \\ m_j \text{ is of the form } \text{public } t \text{ } id^M(t_1^F \text{ } id_1^F, \dots, t_n^F \text{ } id_n^F) \{ t_1 \text{ } id_1; \dots; t_r \text{ } id_r; s_1 \dots s_q \text{ return } e; \} \end{array}}{\text{methodtype}(id, id^M) = (t_1^F, \dots, t_n^F) \rightarrow t} \quad (12)$$

$$\frac{\begin{array}{l} \text{class } id \{ \dots m_1 \dots m_k \} \text{ is in the program} \\ \text{for all } j \in 1..k : \text{methodname}(m_j) \neq id^M \end{array}}{\text{methodtype}(id, id^M) = \perp} \quad (13)$$

$$\frac{\begin{array}{l} \text{class } id \text{ extends } id^P \{ \dots m_1 \dots m_k \} \text{ is in the program} \\ \text{for some } j \in 1..k : \text{methodname}(m_j) = id^M \\ m_j \text{ is of the form } \text{public } t \text{ } id^M(t_1^F \text{ } id_1^F, \dots, t_n^F \text{ } id_n^F) \{ t_1 \text{ } id_1; \dots; t_r \text{ } id_r; s_1 \dots s_q \text{ return } e; \} \end{array}}{\text{methodtype}(id, id^M) = (t_1^F, \dots, t_n^F) \rightarrow t} \quad (14)$$

$$\frac{\begin{array}{l} \text{class } id \text{ extends } id^P \{ \dots m_1 \dots m_k \} \text{ is in the program} \\ \text{for all } j \in 1..k : \text{methodname}(m_j) \neq id^M \end{array}}{\text{methodtype}(id, id^M) = \text{methodtype}(id^P, id^M)} \quad (15)$$

Rule (15) is an inheritance lookup rule: it applies only when the subclass does not declare the method. Its equality is unchanged.

6.6 The *noOverloading* Helper Function

For a method declared in class id with direct superclass id^P , either there is no inherited method of that name, or the declaration must be a valid override. An override has exactly the same parameter types, in the same order, and a return type that is the same as, or a subtype of, the inherited return type.

$$\frac{\text{methodtype}(id^P, id^M) = \perp}{\text{noOverloading}(id, id^P, id^M)} \quad (16a)$$

$$\frac{\begin{array}{l} \text{methodtype}(id, id^M) = (t_1, \dots, t_n) \rightarrow t \\ \text{methodtype}(id^P, id^M) = (t'_1, \dots, t'_n) \rightarrow t' \\ t_i = t'_i \quad (i \in 1..n) \quad t \leq t' \end{array}}{\text{noOverloading}(id, id^P, id^M)} \quad (16b)$$

Both parameter lists have length n ; parameter names may differ. Changing a parameter type, even to a subtype, or changing the parameter count is forbidden.

7 Type Rules

7.1 Type Judgments

We use the following seven forms of judgments:

Judgment	Meaning
$\vdash g$	The goal (whole program) type checks.
$\vdash mc$	The main class type checks.
$\vdash d$	The type declaration type checks.
$C \vdash m$	The method declaration type checks in class C .
$A, C \vdash s$	The statement type checks in environment A , class C .
$A, C \vdash e : t$	The expression has type t in environment A , class C .
$A, C \vdash p : t$	The primary expression has type t in that context.

7.2 Goal

$$\frac{\text{distinct}(\text{classname}(mc), \text{classname}(d_1), \dots, \text{classname}(d_n)) \quad \vdash mc \quad \vdash d_i \ (i \in 1..n)}{\vdash mc \ d_1 \dots d_n} \quad (17)$$

7.3 Main Class

$$\frac{\text{distinct}(id_1, \dots, id_r) \quad [id_1 : t_1, \dots, id_r : t_r], \perp \vdash s_i \ (i \in 1..q)}{\vdash \text{class } id \ \{\text{public static void main}(\text{String}[] \ id^S)\{t_1 \ id_1; \dots; t_r \ id_r; \ s_1 \dots s_q\}\}} \quad (18)$$

Here $\perp$ in the class position denotes the absence of an instance context; **this** is unavailable in the static main method.

Examples of the corrected return and overriding rules

Assume **B extends A**. Each row considers the stated type constraint; the rest of the program must also type check.

Situation	Result
A method declared to return A returns new B() .	Allowed
A method declared to return B returns new A() .	Type error
An inherited A f(A x) is overridden by B f(A y) .	Allowed
An inherited A f(A x) is replaced by B f(B x) .	Type error: parameter type changed
An inherited B f(A x) is overridden by A f(A x) .	Type error: return type widened

The parameter equality in rule (16b) concerns method *declarations*. At a method *call*, rule (35) permits argument expressions whose types are subtypes of the declared parameter types.

7.4 Type Declarations

$$\frac{\begin{array}{c} \text{distinct}(id_1, \dots, id_f) \\ \text{distinct}(\text{methodname}(m_1), \dots, \text{methodname}(m_k)) \\ id \vdash m_i \quad (i \in 1..k) \end{array}}{\vdash \text{class } id \{t_1 \ id_1; \dots; t_f \ id_f; \ m_1 \dots m_k\}} \quad (19)$$

$$\frac{\begin{array}{c} \text{distinct}(id_1, \dots, id_f) \\ \text{distinct}(\text{methodname}(m_1), \dots, \text{methodname}(m_k)) \\ \text{noOverloading}(id, id^P, \text{methodname}(m_i)) \quad id \vdash m_i \quad (i \in 1..k) \end{array}}{\vdash \text{class } id \text{ extends } id^P \{t_1 \ id_1; \dots; t_f \ id_f; \ m_1 \dots m_k\}} \quad (20)$$

7.5 Method Declarations

$$\frac{\begin{array}{c} \text{distinct}(id_1^F, \dots, id_n^F) \quad \text{distinct}(id_1, \dots, id_r) \\ A = \text{fields}(C) \cdot [id_1^F : t_1^F, \dots, id_n^F : t_n^F] \cdot [id_1 : t_1, \dots, id_r : t_r] \\ A, C \vdash s_i \quad (i \in 1..q) \quad A, C \vdash e : t' \quad t' \leq t \end{array}}{C \vdash \text{public } t \ id^M(t_1^F \ id_1^F, \dots, t_n^F \ id_n^F) \{t_1 \ id_1; \dots; t_r \ id_r; \ s_1 \dots s_q \ \text{return } e; \}} \quad (21)$$

The return expression's type t' may be a subtype of the declared return type t . This check applies to every method, whether or not it overrides another.

7.6 Statements

$$\frac{A, C \vdash s_i \quad (i \in 1..q)}{A, C \vdash \{s_1 \dots s_q\}} \quad (22)$$

$$\frac{A(id) = t_1 \quad A, C \vdash e : t_2 \quad t_2 \leq t_1}{A, C \vdash id = e; } \quad (23)$$

$$\frac{A(id) = \text{int}[] \quad A, C \vdash e_1 : \text{int} \quad A, C \vdash e_2 : \text{int}}{A, C \vdash id[e_1] = e_2; } \quad (24)$$

$$\frac{A, C \vdash e : \text{boolean} \quad A, C \vdash s_1 \quad A, C \vdash s_2}{A, C \vdash \text{if } (e) \ s_1 \ \text{else } s_2} \quad (25)$$

$$\frac{A, C \vdash e : \text{boolean} \quad A, C \vdash s}{A, C \vdash \text{while } (e) \ s} \quad (26)$$

$$\frac{A, C \vdash e : \text{int}}{A, C \vdash \text{System.out.println}(e); } \quad (27)$$

7.7 Expressions and Primary Expressions

$$\frac{A, C \vdash p_1 : \text{boolean} \quad A, C \vdash p_2 : \text{boolean}}{A, C \vdash p_1 \ \&\& \ p_2 : \text{boolean}} \quad (28)$$

$$\frac{A, C \vdash p_1 : t_1 \quad A, C \vdash p_2 : t_2 \quad t_1 \leq t_2 \vee t_2 \leq t_1}{A, C \vdash p_1 \ != \ p_2 : \text{boolean}} \quad (28)$$

$$\frac{A, C \vdash p_1 : \text{int} \quad A, C \vdash p_2 : \text{int}}{A, C \vdash p_1 < p_2 : \text{boolean}} \quad (29)$$

$$\frac{A, C \vdash p_1 : \text{int} \quad A, C \vdash p_2 : \text{int}}{A, C \vdash p_1 + p_2 : \text{int}} \quad (30)$$

$$\frac{A, C \vdash p_1 : \text{int} \quad A, C \vdash p_2 : \text{int}}{A, C \vdash p_1 - p_2 : \text{int}} \quad (31)$$

$$\frac{A, C \vdash p_1 : \text{int} \quad A, C \vdash p_2 : \text{int}}{A, C \vdash p_1 * p_2 : \text{int}} \quad (32)$$

$$\frac{A, C \vdash p_1 : \text{int}[] \quad A, C \vdash p_2 : \text{int}}{A, C \vdash p_1[p_2] : \text{int}} \quad (33)$$

$$\frac{A, C \vdash p : \text{int}[]}{A, C \vdash p.\text{length} : \text{int}} \quad (34)$$

$$\frac{A, C \vdash p : D \quad \text{methodtype}(D, id) = (t'_1, \dots, t'_n) \rightarrow t \quad A, C \vdash e_i : t_i \quad t_i \leq t'_i \ (i \in 1..n)}{A, C \vdash p.id(e_1, \dots, e_n) : t} \quad (35)$$

$$A, C \vdash c : \text{int} \quad (36)$$

$$A, C \vdash \text{true} : \text{boolean} \quad (37)$$

$$A, C \vdash \text{false} : \text{boolean} \quad (38)$$

$$\frac{id \in \text{dom}(A)}{A, C \vdash id : A(id)} \quad (39)$$

$$\frac{C \neq \perp}{A, C \vdash \text{this} : C} \quad (40)$$

$$\frac{A, C \vdash e : \text{int}}{A, C \vdash \text{new int}[e] : \text{int}[]} \quad (41)$$

$$A, C \vdash \text{new id}() : id \quad (42)$$

$$\frac{A, C \vdash e : \text{boolean}}{A, C \vdash !e : \text{boolean}} \quad (43)$$

$$\frac{A, C \vdash e : t}{A, C \vdash (e) : t} \quad (44)$$
